A3874

# Wisconsin oats and barley performance tests—2014

John Mochon and Shawn Conley

The Wisconsin oats and barley performance trials are conducted each year with the producer's needs in mind. Trials include released varieties, experimental lines from Wisconsin and neighboring states, and lines from private seed companies. The primary objective of these trials is to obtain data on how varieties perform in different locations and years. Growers use these data to help choose the best varieties to plant, and breeders use performance data to determine whether or not to release a new variety.

New varieties developed and released in Wisconsin are entered in the Wisconsin Certification Program. These varieties have demonstrated superior production qualities. In addition, highly rated varieties from other states may be recommended and/or certified in the state. As new varieties are released to the public, older varieties with inferior qualities are removed from the recommended list and eventually dropped from the certified list as seed production declines.

Occasionally, varieties are certified without being recommended to Wisconsin growers. Varieties in this category may include commercial varieties developed by private seed companies or varieties where there is a substantial market for Wisconsin-produced seed. Thus, in Wisconsin, recommendation and certification do not mean the same thing. Recommended varieties are those with superior in-state production performance records, while certification provides the assurance of seed purity and seed quality.

# Variety selection

Factors to consider when selecting oat and barley varieties include grain yield, maturity, straw strength (or resistance to lodging), and disease resistance. Disease ratings are performed by the University of Wisconsin–Madison Department of Agronomy. Barley growers should consider whether a variety is acceptable for malting. Several varieties are also evaluated for forage yield (tables 4 and 7).

### How the entries were tested

Varieties included in the trial are selected based upon current demand, availability, and adaptation to Wisconsin's climate. Most of these entries are commercially available. Several commercial and public cultivars were included for comparison.

Tests were conducted at seven locations using conventional tillage practices. All plots were planted at a seeding rate of 2.5–3.0 bushels per acre. Agronomic practices at all locations are listed in table 1. Tests were conducted using four replications.

Location	Cooperators	Soil type	Row spacing (inches)	Average nitrogen applied (lb/a)	Planting date	Harvest date	
Arlington	J. Albertson, N. Brickl	silt loam	6.0	30*	April 29	July 31	
Chilton	Kolbe Seeds, M. Glewen	red clay	12.0	-			
Lancaster	A. Crooks	silt loam	7.5	16.5	May 15	Aug.13	
Madison	J. Mochon, T. Wright	silt loam	6.0	30*	May 2	Aug.8	
Marshfield	J. Cavadini	silt loam	6.0	barley: 50, oats: 40	May15	Aug. 22	
Spooner	P. Holman	sandy loam	7.3	53	May 7	Aug. 20	
Sturgeon Bay	M. Stasiak	silt loam	12.0	46	June 4	Sept. 4	

<sup>\*</sup> Nitrogen credited from previous alfalfa or soybean.

### Growing conditions

2013 season. Wisconsin oats production was at 6.83 million bushels produced, down 12% from 2012. This was the lowest production since record keeping began in 1866. The 2013 oat yield was 65.0 bushels per acre, up 5 bushels from the previous year. Planted acres totaled 255,000 in 2013, up 16% from 2012. There were 105,000 acres harvested, a decrease of 25,000 acres from the previous year.

Wisconsin barley production was 784,000 bushels in 2013, up 19% from 2012. Yield was 49 bushels per acre, up 5 bushels from the previous year. Area planted to barley was 33,000 acres, unchanged from last year, and 16,000 acres were harvested, which was an increase of 1,000 acres from 2012.

2012 season. In Wisconsin, oats planted acres totaled 220,000 in 2012, up nearly 5% from 2011. There were 130,000 acres harvested, which was an increase of 15,000 acres from the previous year. The 2012 oats yield was 60.0 bushels per acre, down 2 bushels from the previous year. The increase in acres harvested resulted in a 9% increase in total production compared to last year. At 7.8 million bushels produced, Wisconsin was the second largest oat-producing state in 2012, after Minnesota.

Wisconsin produced 660,000 bushels of barley in 2012, down 6% from 2011 and down 54% from 2010. Area planted to barley, at 33,000 acres, was the same as last year, as was area harvested, at 15,000 acres. Yield was down 3 bushels from the previous year to 44 bushels per acre.

Source: USDA National Agricultural Statistics Service, www.nass.usda.gov.

### How performance was measured

Yield: After threshing, grain was weighed and yield was determined using a conversion formula. Yields are reported in bushels per acre at 8% moisture content. There are 32 and 48 pounds per bushel for oat and barley, respectively.

**Lodging:** Lodging is measured in percent. Values are rounded to whole numbers (1=none, 100=severe).

**Test weight:** Test weights were measured using a Toledo Model 3111 test weighting scale.

### **Licensed varieties**

The Wisconsin Agricultural Experiment Station and/or the UW-Madison Department of Agronomy has granted sole authority to the Wisconsin Crop Improvement Association to issue formal licenses for the production of certified seed of Kewaunee barley; Spooner rye; and Badger, Dane, ForagePlus, Gem, and Vista oats. The Wisconsin Alumni Research Foundation has granted sole authority to the Wisconsin Crop Improvement Association to issue formal licenses for the production of certified seed of Drumlin, Esker, Kame, and Moraine oats. These grants of sole authority are intended to reinforce Plant Variety Protection (PVP) regulations and to generate research and development funds for the Wisconsin small-grain breeding program. These varieties are PVP-protected and a license is required for seed production. Each bag of seed will have a special red and white PVP/ Licensed Variety tag attached or preprinted on the bag.

# **Testing agencies**

The small grain variety tests were conducted by the Department of Agronomy, College of Agricultural and Life Sciences, University of Wisconsin–Madison in cooperation and with support from the Wisconsin Crop Improvement Association.

## **Additional information**

Check the following publications for additional information on small grain production and seed availability. All are updated annually.

- Wisconsin Winter Wheat Performance Tests (A3868), available at learningstore.uwex.edu
- Pest Management in Wisconsin Field Crops (A3646), available at learningstore.uwex.edu
- The Wisconsin Certified Seed Directory, available at wcia.wisc.edu

For information on seed availability of public varieties, contact:

Wisconsin Crop Improvement Association 554 Moore Hall 1575 Linden Drive Madison, WI 53706 (608) 262-1341 wcia.wisc.edu

<sup>\*</sup> Varieties not significantly different from the highest yielding variety in the trial.

<sup>&</sup>lt;sup>a</sup> The LSD (least significant difference) figures listed under the yield columns are a statistical measure of variation within the trial. If the difference in yield of two varieties is equal to or greater than the LSD, the yields are significantly different. If the difference is less than the LSD, the yield difference may have been due to environmental factors.
